CLIENT SCENARIO:

My product is a resource for developers. A metaphor for this product would be like having a room full of software experts at your disposal to ask questions for any issue you encounter.

On my application, developers ask questions to the community of developers. Experts or anyone from the community can respond to the question. Developers can comment on answers as well. Developers will be able to browse questions and search for questions based on keywords.

Developers can up-vote if they agree with the answer, or down-vote if they disagree. This would sort answers to the question based on their validity--with the answers that receive the highest number of up-votes appearing at the top, and those with the lowest appearing at the bottom.

Each developer can have an account. They must have an account if they wish to ask questions or respond to questions and/or answers. Developers can browse questions without an account. They can also up-vote and down-vote answers without an account. A developer's account can be updated to have a profile picture. The profile page shows all the questions that the developer has asked or responded to.

Please provide at least ten (10) user stories from the scenario above in the prescribed format:

"As a _____, I want _____, so that _____".

Be careful to use the correct user type (i.e., developer, account holder) when you are writing your user stories.

1. As a developer, I want to be able to browse and search questions by keyword, so that I can see if my question has already been answered.
2. As a developer, I want to be able to browse and search questions without having to login, so that I can quickly find information that I need.
3. As an account holder, I want to be able to login, so that I can post a question.
4. As an account holder, I want to be able to login, so that I can respond to questions and/or answers.
5. As an account holder, I want to be able to post a comment to an answer, so that I can provide additional information and/or ask for clarification.
6. As a developer, I want to be able to upvote an answer, so that the most valid answers are listed at the top of a question.
7. As a developer, I want to be able to downvote an answer, so that the less valid or incorrect answers are listed near the bottom of a question.
8. As a developer, I want to be able to upvote or downvote answers without having to login, so that I can save time while providing feedback.
9. As an account holder, I want to update my account to have a profile picture, so that others can quickly recognize me.
10. As a developer, I want to browse another member's profile page, so that I can see all of the questions they have asked or responded to.
